**Unit 5, Lesson 11****Filling containers**

Let's fill containers with water.

**11.1 Which One Doesn't Belong: Solids**

These are drawings of three-dimensional objects. Which one doesn't belong? Explain your reasoning.

A

B

C

D

**11.2 Height and Volume**

Your teacher will give you a graduated cylinder, water, and some other supplies. Your group will use these supplies to investigate the height of water in the cylinder as a function of the water volume.

1. Before you get started, make a prediction about the shape of the graph.
2. Fill the cylinder with different amounts of water and record the data in the table.

<b>volume (ml)</b>						
<b>height (cm)</b>						

3. Create a graph that shows the height of the water in the cylinder as a function of the water volume.

4. Choose a point on the graph and explain its meaning in the context of the situation.

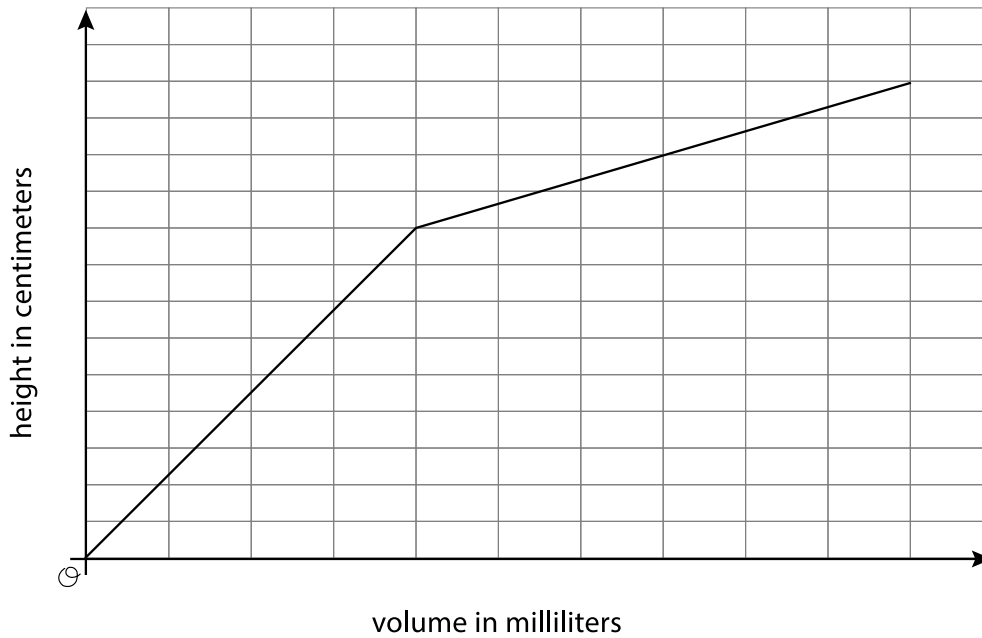

## 11.3 What Is the Shape?

1. The graph shows the height vs. volume function of an unknown container. What shape could this container have? Explain how you know and draw a possible container.

## Lesson 11 Summary

When filling a shape like a cylinder with water, we can see how the dimensions of the cylinder affect things like the changing height of the water. For example, let's say we have two cylinders, *D* and *E*, with the same height, but *D* has a radius of 3 cm and *E* has a radius of 6 cm.

If we pour water into both cylinders at the same rate, the height of water in *D* will increase faster than the height of water in *E* due to its smaller radius. This means that if we made graphs of the height of water as a function of the volume of water for each cylinder, we would have two lines and the slope of the line for cylinder *D* would be greater than the slope of the line for cylinder *E*.
